Homework III

I. REMARK

- Reading materials: Ch 1-6 in the textbook.
- “Can not see the wood for the trees!!”
- Upload your answer sheets and MATLAB code files. If the code is not working, you might get no points. Also, don’t just copy the code from your colleagues.

II. PROBLEM SET

Non-textbook problem 1.: The function x(t) is given as x(t)=rect(t). Do sampling the function 100 times over the time interval -3≤t<3. Plot the x(t) and approximated abs(X(f)) using DFT (FFT) of the sampled signal.

Non-textbook problem 2.: The function x(t) is given as x(t)=cos(2πft). Do sampling the function over the time interval 0≤t<10. The frequency f is 1 Hz, and the sampling frequency is 10 Hz. Plot the x(t) and approximated X(f) using DFT (FFT) of the sampled signal.

Non-textbook problem 3.: The purpose of the task is making a song. Find the music (score) of the song below. For every scale, use a cosine or sine function. Use the table below describing the sinusoidal frequency of every scale. Assume the time period for a quarter note is 0.5 sec. The sampling frequency should be 44100Hz.

a) Use octave 3 for making the signal x(t) of the song. Plot the x(t) and approximated abs(X(f)) using DFT (FFT) of the sampled signal. Listen the song using the ‘sound’ function.
b) Use octave 4 for making the signal z(t) of the song. Plot the z(t) and approximated abs(Z(f)) using DFT (FFT) of the sampled signal. Listen the song using the ‘sound’ function.
c) Make the signal w(t) = x(t)+z(t). Plot the w(t) and approximated abs(W(f)) using DFT (FFT) of the sampled signal. Listen the song using the ‘sound’ function.
d) Make a loss pass filter h(t) using a sinc function. The filter should pass only the frequency band for octave 3 (ex. 130Hz~250Hz). Plot h(t) and approximated abs(H(f)) using DFT (FFT) of the sampled signal. Filter the signal w(t) through y(t) = w(t)*x(t) where * denotes the convolution operator. Plot the approximated abs(Y(f)) using DFT (FFT). Listen real(y(t)) using the ‘sound’ function.
